Vaultwarden & Caddy - config example

Very basic example how to set up vaultwarden with caddy as reverse proxy using docke compose

Requirements

- git
- docker
- internet connection during installation (to download docker images)

Installation

1. Clone repo `shell    git clone https://github.com/szymon-romanko/vaultwarden_example.git cd vaultwarden_example`

2. Setup TLS certificates

   For development - generate self-signed certificates `shell   chmod u+x ./generate_certs.sh  ./generate_certs.sh  ls certs/  # verify they are generated`

   For production - use your own certificates `shell   cp /path/to/your/cert.pem certs/cert.pem  cp /path/to/your/key.pem certs/key.pem  vi docker-compose.yml  # change paths to your certificates`

3. Start services `shell    docker compose up -d`
