Vaultwarden & Caddy - config example

Very basic example how to set up vaultwarden with caddy as reverse proxy using docke compose

Requirements

- git
- docker
- internet connection during installation (to download docker images)

Installation

1. Clone repo

   ```
   git clone https://github.com/szymon-romanko/vaultwarden_example.git
   cd vaultwarden_example
   ```

2. Setup TLS certificates

   For development - generate self-signed certificates

   ```
   chmod u+x ./generate_certs.sh
   ./generate_certs.sh
   ls certs/  # verify they are generated
   ```

   For production - use your own certificates

   ```
   cp /path/to/your/cert.pem certs/cert.pem
   cp /path/to/your/key.pem certs/key.pem
   vi docker-compose.yml  # change paths to your certificates
   ```

3. Start services

   ```
   docker compose up -d
   ```
